

Data Interpretation Topical Discussion Guide

Interpreting Emotional Safety School Climate Survey Data

Introduction

This *Discussion Guide* provides suggestions to help you use your school climate data to make meaningful interpretations about the topic of Emotional Safety within your state, district, or school, taking into account the viewpoints of the people who took the survey in your state, district, or school (i.e., students, instructional staff, noninstructional staff, parents/guardians).¹ It accompanies the School Climate Improvement Resource Package (SCIRP) [Data Interpretation Guide](#), which contains information, support, and resources to help you interpret and use your survey results, using the U.S. Department of Education (ED) School Climate Surveys (EDSCLS) [model](#) of school climate domains and topic areas as a framework. We encourage you to read the full [Data Interpretation Guide](#) before using this *Discussion Guide* so that you have a better understanding of the model and types of results you will see.

This document is intended for use by EDSCLS users as well as users of other school climate surveys, which often include a topic area similar in composition to the Emotional Safety topic area in the EDSCLS. Directions specific to EDSCLS users are denoted in this guide with the EDSCLS logo (right).

This guide, along with the [Data Interpretation Guide](#), can help you to derive meaning from your state's, district's, or school's Emotional Safety results, which you can use to identify areas for improvement.^{2,3} In the following sections, you will find:

- A definition of emotional safety as it relates to school climate
- Guiding questions to help you think through your Emotional Safety data from a multi-tiered perspective—universal and targeted (Click on the [Data Interpretation Guide](#) and the [Reference Manual](#) to find additional information on multi-tiered approaches.)
- Guiding questions organized by data types (Emotional Safety scale scores and item-level Emotional Safety data):
 - Initial and deeper guiding questions about Emotional Safety for districts ([Appendix A](#))
 - Initial and deeper guiding questions about Emotional Safety for schools ([Appendix B](#))

¹ This document provides strategies applicable to public schools and districts, including charter authorizers, charter management organizations, education management organizations, individual charter schools, charter local educational agencies, and private schools.

²  Information in this *Discussion Guide* has been updated to reflect a change in the reporting of scale scores. Beginning with the release of the EDSCLS platform Virtual Machine (VM) 3.0 in December 2017, the platform reports benchmarked scale scores, allowing users to compare scale score levels across the EDSCLS domains and topic areas. Note that the scale scores themselves cannot be compared across domains; only the levels in which they fall can be compared in this way.

³  States that host the EDSCLS can use the same suggestions as given here for districts; states will also be able to compare data across their districts, as well as across their schools.

- A link to an [Emotional Safety webpage](#) that includes resources on interventions that districts and schools can implement immediately to address specific areas of need as well as longer term resources for improving emotional safety
- Additional guiding questions for those wishing to use average (mean) Emotional Safety values:
 - Initial and deeper guiding questions about Emotional Safety for **districts** using average (mean) Emotional Safety values ([Appendix C](#))
 - Initial and deeper guiding questions about Emotional Safety for **schools** using average (mean) Emotional Safety values ([Appendix D](#))

Schools and districts are also required to report information about school climate pursuant to ED’s Civil Rights Data Collection (CRDC). Information collected by the EDSCLS or other similar surveys may help schools and districts prepare their responses to the CRDC survey. More information about the CRDC can be found at ocrdata.ed.gov.

What Is Emotional Safety?

For the purposes of interpreting data, we have defined emotional safety as an experience in which one feels safe to express emotions, security, and confidence to take risks and feels challenged and excited to try something new. Emotionally safe learning environments can be achieved by making social and emotional learning (SEL) an essential part of education. SEL is the process through which children and adults acquire the knowledge, attitudes, and skills they need to recognize and manage their emotions, feel and show empathy to others, establish positive relationships, and make responsible decisions. Competence in the use of SEL skills is promoted in the context of safe and supportive school, family, and community learning environments in which children feel valued, respected, and connected to and engaged in learning.

You can find a brief overview of emotional safety as it relates to school climate [here](#).

Guidance for Districts and Schools

1. Examining Emotional Safety Data Overall: Focus on a Universal Approach

You can use your Emotional Safety scale scores to focus on a universal approach to improving emotional safety. Scale scores (described in the [Data Interpretation Guide](#)) are the premier way that the EDSCLS as well as many other school climate surveys measure school climate. A scale score, which combines multiple survey items related to different aspects of a topic area such as Emotional Safety, is a more robust measure than just attempting to measure that topic by asking about it with a single item.

Beginning with the release of the EDSCLS platform VM 3.0 in December 2017, the way the EDSCLS platform reports scale scores changed. Based on psychometric benchmarking, the scale scores are anchored into fixed cut scores across EDSCLS

domains and topic areas, allowing users to compare all scale score levels no matter the topic or domain (i.e., you can compare benchmarked scale score levels for topic areas within and across the three EDSCLS domains: Engagement, Safety, and Environment). The platform produces graphs showing three “performance” levels into which the benchmarked scale scores may fall: Least Favorable, Favorable, and Most Favorable.⁴

CAUTIONS: You cannot compare the scale scores themselves across domains; only the levels in which they fall can be compared in this way. (However, you can compare the scores themselves within domains.) Also, you cannot compare older “legacy” scale scores to newer benchmarked scale scores.

Because any EDSCLS data produced by platforms lower than VM 3.0 are not recalibrated, the scale scores they produced, called “legacy” scores, cannot be compared to the new benchmarked scale scores. If you want to preserve a trend line, you can convert your older legacy scores from prior years to benchmarked scale scores and then compare across years. You will find information on how to convert legacy scores to benchmarked scores at <https://safesupportivelearning.ed.gov/edscls/benchmarks>.

After you have these data for your district’s or school’s students and staff, and you have read the [Data Interpretation Guide](#), you can use initial guiding questions in Appendix A (for districts) and in Appendix B (for schools) to help make meaningful interpretations of your results.

If you are a **district**, click on [Appendix A](#) to go to initial guiding questions for overall Emotional Safety scale scores.

If you are a **school**, click on [Appendix B](#) to go to initial guiding questions for overall Emotional Safety scale scores.

Average (mean) topic area values (see “Appendix C. Average (Mean) Topic Area Values” in the [Data Interpretation Guide](#)) also can be used to focus on a universal approach to improving emotional safety. As described in the [Data Interpretation Guide](#), average (mean) topic area values can be used to gauge how favorably respondents perceive the topic.⁵

If you are a **district**, click on [Appendix C](#) to go to initial guiding questions for overall average (mean) Emotional Safety values.

If you are a **school**, click on [Appendix D](#) to go to initial guiding questions for overall average (mean) Emotional Safety values

⁴  The EDSCLS platform produces graphs showing three “performance” levels into which the benchmarked scale scores may fall: *Least Favorable* (scale scores below 300): The most likely answer to each positively valenced question in the scale is *disagree* or *strongly disagree*; the most likely answer to each negatively valenced question in the scale is *agree* or *strongly agree*. *Favorable* (scale scores 300-400): The most likely answer to each positively valenced question in the scale is *agree*; the most likely answer to each negatively valenced question in the scale is *disagree*. *Most Favorable* (scale scores above 400–500): The most likely answer to each positively valenced question in the scale is *strongly agree*; the most likely answer to each negatively valenced question in the scale is *strongly disagree*. (See the [Data Interpretation Guide](#) for further information.)

⁵  Average (mean) topic area values are not directly available from the EDSCLS platform but can be calculated from raw survey data. See [Appendix C](#) in the [Data Interpretation Guide](#) for information about calculating, using, and interpreting average (mean) topic area values.

2. Examining Emotional Safety Data Across Student and Staff Respondent Characteristics: Focus on a Targeted Approach

Emotional Safety scale scores broken out by respondent characteristics provide a richer set of data and a way to see how perceptions of emotional safety differ across subgroups of students and staff.

Benchmarked scale scores are produced for EDSCLS users for the following subgroups.⁶

- Student scale scores per topic area can be examined by:
 - Gender,
 - Race/ethnicity, and
 - Grade.
- Staff (instructional and noninstructional) scale scores per topic area can be examined by:
 - Gender and
 - Race/ethnicity.

Note: In the event of a possible disclosure risk that would allow a respondent or small subgroup of respondents to be identified (e.g., if there is only one Asian teacher in the school), the EDSCLS platform will suppress the results for that subgroup (i.e., results for that subgroup will not be shown). (To understand how a small subgroup perceives school climate, see the [Reference Manual](#) for tips on conducting interviews and focus groups.)

Examining student and staff perceptions of emotional safety in your district or school by respondent characteristics can be extremely useful, not only in understanding the areas of strength and weakness in your school environment, but also in targeting interventions. For example, if perceptions of emotional safety differ by student characteristics (gender, race/ethnicity, grade), this will help you highlight areas of targeted need.

Supports should be designed to improve school climate for the students who are most in need regardless of the subgroup(s) to which they belong. Targeting supports based on need as opposed to membership in a subgroup will support compliance with relevant civil rights laws.

If you are a **district**, click on [Appendix A](#) to go to initial guiding questions for Emotional Safety scale scores **by respondent characteristics**.

If you are a **school**, click on [Appendix B](#) to go to initial guiding questions for Emotional Safety scale scores **by respondent characteristics**.

WHAT ABOUT EXAMINING SURVEY RESULTS BY PARENT/GUARDIAN CHARACTERISTICS?

Because of the brevity of the parent/guardian survey, the EDSCLS was not designed to produce scale scores or average (mean) Emotional Safety values for parents; however, parent results can be examined at the item level, which is discussed in the section [Digging Deeper Into the Data by Using Item-Level Data](#).

⁶  Note that the EDSCLS platform does not produce crossed demographics (e.g., Asian females). Users can obtain crossed demographics analytically by downloading the raw data file.

Average (mean) topic area values also can be used to focus on a targeted approach to improving emotional safety.

If you are a **district**, click on Appendix C to go to initial guiding questions for overall average (mean) Emotional Safety values **by respondent characteristics**.

If you are a **school**, click on Appendix D to go to initial guiding questions for overall average (mean) Emotional Safety values **by respondent characteristics**.

WHAT ABOUT USING ITEM-LEVEL DATA TO EXAMINE PARENTS'/GUARDIANS' PERCEPTIONS?

Yes! As noted earlier, the EDSCLS parent data do not include Emotional Safety scale scores; however, parent/guardian item-level data can be used to consider how parents perceive specific areas of emotional safety.

3. Digging Deeper Into the Data by Using Item-Level Data: Focus on a Targeted Approach

After you have examined your scale scores (and average [mean] Emotional Safety values, if you wish to use them), looking at item-level data may help you to dig deeper to target specific areas or issues. (See the *Data Interpretation Guide* to learn more about examining [item-level data](#).) Item-level results can often provide districts and schools with concrete information on emotional safety that may be more actionable, warranting more immediate implementation of interventions found on the [Emotional Safety webpage](#), as well as planning and preparation for longer term interventions and strategies.

Sites using the EDSCLS platform can produce percentage distributions and item averages (means) for each item in the survey that is included in the Emotional Safety scale produced by the platform as well as any important Emotional Safety items that are not in the scale but have been kept on the survey as stand-alone items.

These guiding questions include suggestions for examining item-level data about how:

- An Emotional Safety item is perceived by individual respondent groups;
- An Emotional Safety item is perceived across respondent groups, but only for items *worded exactly the same way* for each group (called *comparable items*); and
- Emotional Safety items organized by content (called an *item content groups*) are perceived across respondent groups.

These types of guiding questions are detailed here.

A. Examining Emotional Safety Items Within a Respondent Group

You can compare individual Emotional Safety items with each other within an individual respondent group (students, instructional staff, noninstructional staff, or parents/guardians). Comparing items in this way may provide districts and schools with concrete examples of emotional safety that may be more actionable, warranting more immediate implementation of interventions found on the [Emotional Safety webpage](#), as well as planning and preparation for longer term interventions and strategies.

However, we strongly encourage you not to focus excessively on a single item rather than the more robust construct (topic area) of which it is a part. If you focus change efforts solely on behaviors and attitudes as defined by specific items, you may run the risk of a form of unintentional “teaching to the test” in which you are able to show growth with respect to specific items even though perceptions of the underlying topic area have not changed.

When comparing the averages (means) of individual items, it is important to make sure that you are comparing “apples to apples.” Sometimes a high average (mean) item value represents a positive perception and sometimes a high average (mean) item value represents a negative perception, depending on how the item response options of 1–4 are valenced, or directed. If you want to compare item averages (means) of items, go to the *Data Interpretation Guide* section on [item valence and reverse-coding](#) to access important information you will need before comparing them.⁷

For sites using the EDSCLS, negatively valenced items are marked for you in the EDSCLS codebook and survey item lists (questionnaires) at <https://safesupportivelearning.ed.gov/edscls/administration> and in [Table 1](#) below.

B. Comparing Emotional Safety Items Across Respondent Groups if Worded Exactly the Same Way

Item frequencies and averages (means) can be examined across respondent groups, *but only if the items are worded exactly the same way*. This approach is helpful in cases where differences between groups or subgroups of respondents were found in the Emotional Safety scale scores (or average [mean] values, if applicable). For example, both instructional staff and noninstructional staff are presented with the item “I feel satisfied with the recognition I get for doing a good job.” Because the survey items are identical, you can compare the responses of instructional staff to the responses of noninstructional staff on this item.

C. Considering Emotional Safety Item Content Groups

Although looking at scale scores and items in the survey is important in examining and interpreting your data, it may be overwhelming to examine all of the items at once, and you may want to look at them in chunks or groups by substantive content. You are free to use groups of items of similar substantive content that are important to your district or school. We provide examples from the EDSCLS in [Table 1](#), although similar groupings may be found in other school climate surveys.

Table 1 displays items included in the EDSCLS Emotional Safety scale from all respondent groups as well as any important stand-alone items that have been retained. In the table, we suggest the following areas of focus using the Emotional Safety items in the EDSCLS: Staff Emotional Safety; Feeling Accepted; Students Get Along With Other Students; Social-Emotional (SEL) Development; and Staff Efficacy: Behavior Management.

⁷ Note that all of the items in Emotional Safety are positively valenced; therefore, item averages (means) within this topic area can be compared directly.

Table 1. Item Content Groupings for the Emotional Safety Topic Area

Staff Emotional Safety

Instructional staff	I feel satisfied with the recognition I get for doing a good job.
Instructional staff	I feel comfortable discussing feelings, worries, and frustrations with my supervisor.
Instructional staff	This school inspires me to do the very best at my job.
Instructional staff	People at this school care about me as a person.
Noninstructional staff	I feel satisfied with the recognition I get for doing a good job.
Noninstructional staff	I feel comfortable discussing feelings, worries, and frustrations with my supervisor.
Noninstructional staff	This school inspires me to do the very best at my job.
Noninstructional staff	People at this school care about me as a person.

Feeling Accepted

Student	I am happy to be at this school.
Student	I feel like I am part of this school.
Student	I feel socially accepted.
Student	I feel like I belong.
Instructional staff	I feel like I belong.
Noninstructional staff	I feel like I belong.
Parent	This school is a friendly place overall.
Parent	Staff at this school care about what families think.
Parent	At this school, the staff really cares about my child.

Students Get Along With Other Students

Student	Students at this school get along well with each other.
---------	---

Social-Emotional (SEL) Development

Student	At this school, students talk about the importance of understanding their own feelings and the feelings of others.
Student	At this school, students work on listening to others to understand what they are trying to say.

Staff Efficacy: Behavior Management

Instructional staff	I can manage almost any student behavior problem.
Noninstructional staff	I can manage almost any student behavior problem.

These content areas provide an example of how you can examine Emotional Safety items in a meaningful way across respondent groups. Identifying differences in the perceptions of different

respondent groups within the same block of items may be especially helpful in targeting action items for improvement.⁸

For example, at least one question on each survey (i.e., students, instructional staff, noninstructional staff, parents) asks respondents about feeling accepted, as follows:

Student	I am happy to be at this school.
Student	I feel like I am part of this school.
Student	I feel socially accepted.
Student	I feel like I belong.
Instructional staff	I feel like I belong.
Noninstructional staff	I feel like I belong.
Parent	This school is a friendly place overall.
Parent	Staff at this school care about what families think.
Parent	At this school, the staff really cares about my child.

Looking at these items in tandem may provide you with more in-depth information on whether your district or school needs to place more emphasis on emotional safety. If you find that student responses on feelings of acceptance in the school community grouping are not as you would like (or if you find a discrepancy between the perceptions of students and other respondents), you may want to think about the following question:

? What can my district or school do to provide a greater focus on creating a more accepting environment at school?

Similarly, there are survey items that group together as Staff Efficacy: Behavior Management. Looking at the results for this item content group may help you to gauge how well your emotional safety efforts are being practiced. If you find that responses are not as favorable as you would like (or if you find a discrepancy between the perceptions of different respondent groups), consider the following:

? What can my district or school do to better ensure that our emotional safety efforts are addressing the needs of students, staff, and parents?
 What policies and procedures are currently in place in my school to promote emotional safety? What new policies and procedures need to be implemented? Which policies and procedures should we consider modifying or eliminating? What are our state requirements in this area? What are our obligations under Federal civil rights laws in this area?

Note: In all cases, you must comply with your obligations under federal civil rights laws and any applicable state requirements.

⁸ Note that these groupings are different from those for scale scores or average (mean) topic area values, which were derived analytically. The groupings in Table 1 are based on items with similar substantive content or areas of focus that may prove more actionable for districts and schools.

Appendix A: Guiding Questions for Districts

You can use the guiding questions in this appendix to help use your data to focus on universal and targeted approaches to improve emotional safety. In this appendix, you will find:

- Initial guiding questions (scale scores);
- Deeper guiding questions (overall);
- Deeper guiding questions (focused on interventions); and
- Other questions to consider.

Initial Guiding Questions (GQs): District Scale Scores

Scale scores are the premier way that the EDSCLS as well as many other school climate surveys measure school climate. A scale score, which combines multiple survey items related to different aspects of a topic area, is a more robust measure than just attempting to measure the topic by asking about it with a single item. For more information on scale scores, please see the [Data Interpretation Guide](#).

A Universal Approach

GQ1. What does our **student** Emotional Safety scale score tell us about how students perceive emotional safety in our district?

For example, you can examine:

- How do the student Emotional Safety scale scores compare across schools in our district?
- How does our district's student Emotional Safety scale score compare with our state's score (if available)?
- How does our district's student Emotional Safety scale score compare with our district's student scores on other topic areas within the Safety domain—is it relatively low or high, or in the middle?
-  Districts that use the EDSCLS can examine how the student benchmarked scale score levels compare across schools, compare with the district, with other topic areas within and across domains, and across respondent groups.

GQ2. What does our **instructional staff** Emotional Safety scale score tell us about how these staff perceive emotional safety in our district?

For example, you can examine:

- How do the instructional staff Emotional Safety scale scores compare across schools in our district?

Using benchmarked scale scores, you can compare scores of topic areas *within* a domain (Safety, Environment, and Engagement) for individual respondent groups (students, instructional staff, noninstructional staff). You can also compare “performance” levels into which topic area scale scores fall across domains and respondent groups. These comparisons will help you make meaningful interpretations of your data.

For more information, please see [Appendix A in the Data Interpretation Guide](#) for benchmarked scale score interpretations.

Consider using the EDSCLS Data Analysis Worksheet to guide your analysis and interpretation of scale scores.

- 
- How does our district's instructional staff Emotional Safety scale score compare with our state's score (if available)?
 -  Districts that use the EDSCLS can examine how the instructional benchmarked scale score levels compare across schools, compare with the district, with other topic areas within and across domains, and across respondent groups.
 - How does our district's instructional staff scale score compare with our district's instructional staff scores on other topic areas within the Safety domain—is it relatively low or high, or in the middle?
-

GQ3. What does our **noninstructional staff** Emotional Safety scale score tell us about how these staff perceive emotional safety in our district?

For example, you can examine:

- How do the noninstructional staff Emotional Safety scale scores compare across schools in our district?
 - How does our district's noninstructional staff Emotional Safety scale score compare with our state's score (if available)?
 - How does our district's noninstructional staff scale score compare with our district's noninstructional staff scores on other topic areas within the Safety domain—is it relatively low or high, or in the middle?
 -  Districts that use the EDSCLS can examine how the noninstructional benchmarked scale score levels compare across schools, compare with the district, with other topic areas within and across domains, and across respondent groups.
-

A Targeted Approach

GQ4. What do the district emotional safety scale scores **by respondent characteristics** tell us about how different subgroups perceive emotional safety in our district?

For example, you can examine:

- How do the perceptions of emotional safety compare across various subgroups of students (White students versus Asian students)?
 - How do the perceptions of emotional safety compare across various subgroups of instructional staff (e.g., Black or African-American staff versus Asian staff)?
 - How do the perceptions of emotional safety compare across various subgroups of noninstructional staff (e.g., males versus females)?
 -  Districts that use the EDSCLS can examine how topic area benchmarked scale score levels compare across respondent groups and across respondent subgroups.
-

Now that you have considered these questions, what would you like to do next? You can:

- Click on [item-level data](#) to see how item-level results can help provide you with concrete examples of emotional safety that may be more immediately actionable.

Taking a deeper look within a single respondent group will allow for a more thorough picture of that group's perceptions. You also can:

- Click on [deeper guiding questions](#) to help you put all your data (survey, administrative, and qualitative) into context.
- Click on [Emotional Safety](#) to go to a webpage with suggestions for interventions that can be implemented immediately as well as longer term strategies and interventions.

Examining the deeper guiding questions will help you more thoroughly put your data into context and use them moving forward, whereas the webpage will provide suggestions for strategies and interventions that may be implemented immediately.

If you have calculated average (mean) Emotional Safety values, you also can:

- Click on [average \(mean\) Emotional Safety values](#) to look at Emotional Safety values across respondent groups.

Deeper Guiding Questions (DGQs) About Data for Districts

A Universal Approach

- DGQ1. Are there other district-level databases that can give us additional information about what is going on across stakeholders in the district and what actions to take (e.g., administrative data such as incident data, attendance/truancy data, graduation rates, office discipline referrals and disciplinary actions, as well as other data such as Youth Risk Behavior Surveillance System survey data, if available)? (Click on the [Reference Manual](#) for more information on aligning indicators.)
- Do they show the same picture of school climate as your district school climate survey data?
 - What additional information do these data give us?
 - How can we use these data to help us understand universal Emotional Safety needs in our district?
- DGQ2. Based on our overall Emotional Safety scale scores, should we consider emotional safety a priority for improvement in our district?

A Targeted Approach

- DGQ3. Are there other district-level databases that can tell us more about **subgroups of students or staff** needing support in emotional safety (e.g., administrative data such as incident data, attendance/truancy data, graduation rates, office discipline referrals and disciplinary actions, as well as other data such as Youth Risk Behavior Surveillance System survey data, if available)?
- Do they show the same picture of school climate as your district school climate survey data for these subgroups?
 - What additional information do these data give us?
 - How can we use these data to help us understand targeted Emotional Safety needs in our district?

DGQ4. If we are using a three-tiered system of support in our district, what do these data tell us about our use of resources within that system? Are our practices and programs addressing the needs identified by our data?

a. What are our district's Tier 1 resource distribution needs? Tier 2 needs? Tier 3 needs?

DGQ5. Based on our Emotional Safety scale scores **by respondent characteristics**, should we consider emotional safety for certain subgroups of students and staff a priority for improvement in our district?

Other Questions to Consider

DGQ6. How can we drill down to further understand what students and other stakeholders think about emotional safety needs in our district (e.g., convene focus groups of students, staff, parents/guardians; conduct student fishbowls and facilitated discussion sessions)?

DGQ7. Based on our answers to these questions, what conversations do we need to have about using our resources, and with whom should we have them?

Deeper Guiding Questions About Interventions⁹ for Districts

A Universal Approach

DGQ8. What interventions pertaining to emotional safety are currently in place in our district and how can we best evaluate whether these interventions are working?

DGQ9. How can we ensure that these emotional safety interventions are implemented with fidelity?

DGQ10. How do we know which interventions are effective?

a. How can we best evaluate whether these interventions are working?

A Targeted Approach

DGQ11. If we are using a three-tiered system of support in our district, what interventions pertaining to emotional safety have been shown to work that should be continued or expanded at each tier?

DGQ12. What interventions pertaining to emotional safety have been shown to work in other districts, per tier, and what are the conditions under which they work?

DGQ13. What resources do we need to improve emotional safety for our students, per tier, in our district?

DGQ14. Which subgroups of respondents have been found to be in need of targeted support?

DGQ15. What interventions pertaining to emotional safety have worked or are working and should be continued or expanded for students at higher levels of risk in our district?

⁹ Click on the [Reference Manual](#) for more information about interventions such as best practices, strategies, and programs; multi-tiered systems of support; and fidelity of implementation

- 
- DGQ16. What new interventions pertaining to emotional safety can be introduced and implemented that will either provide new support or complement what is already being done at each tier?
- Why do we think these interventions would be more effective than current or past efforts?
- DGQ17. How can we sustain (institutionalize) tiered support for improving conditions pertinent to emotional safety in our district?

Other Questions to Consider

- DGQ18. How can we best fold training for implementing emotional safety interventions into professional development efforts?
- Which training efforts have been successful or unsuccessful in the past?
 - Why were some efforts more successful than others?

Now that you have considered these questions, what would you like to do next? You can:

- Click on [item-level data](#) to see how item-level results can help provide you with concrete examples of emotional safety that may be more immediately actionable.
- Click on [Emotional Safety](#) to go to a webpage with suggestions for interventions that can be implemented immediately as well as longer term strategies and interventions.

If you have calculated average (mean) Emotional Safety values, you also can:

- Click on [average \(mean\) Emotional Safety values](#) to look at Emotional Safety values across respondent groups.

Appendix B: Guiding Questions for Schools

You can use the guiding questions in this appendix to help you use your data to focus on universal and targeted approaches to improve emotional safety. In this appendix, you will find:

- Initial guiding questions (scale scores);
- Deeper guiding questions (overall);
- Deeper guiding questions (focused on interventions); and
- Other questions to consider.

Initial Guiding Questions: School Scale Scores

Scale scores are the premier way that the EDSCLS as well as many other school climate surveys measure school climate. A scale score, which combines multiple survey items related to different aspects of a topic area, is a more robust measure than just attempting to measure the topic by asking about it with a single item. For more information on scale scores, please see the [Data Interpretation Guide](#).

A Universal Approach

GQ1: What does our **student** Emotional Safety scale score tell us about how students perceive emotional safety in our school?

For example, you can examine:

- How does our school's student Emotional Safety scale score compare with our district's student Emotional Safety scale score (if available)?
- How does our school's student Emotional Safety scale score compare with our state's score (if available)?
- How does our school's student Emotional Safety scale score compare with our school's student scores on other topic areas within the Safety domain—is it relatively low or high, or in the middle?
-  Schools that use the EDSCLS can examine how the student benchmarked scale score levels compare with those of the district (if available), with other topic areas within and across domains, and across respondent groups.

GQ2: What does our **instructional staff** Emotional Safety scale score tell us about how these staff perceive emotional safety in our school?

For example, you can examine:

- How does our school's instructional staff Emotional Safety scale score compare with our district's score (if available)?

Using benchmarked scale scores, you can compare scores of topic areas *within* a domain (Safety, Environment, and Engagement) for individual respondent groups (students, instructional staff, noninstructional staff). These comparisons will help you make meaningful interpretations of your data.

For more information, please see [Appendix B](#) in the *Data Interpretation Guide* for benchmarked scale score interpretations.

Consider using the [EDSCLS Data Analysis Worksheet](#) to guide your analysis and interpretation of scale scores.

- How does our school's instructional staff Emotional Safety scale score compare with our state's score (if available)?
 -  Schools that use the EDSCLS can examine how the instructional staff benchmarked scale score levels compare with those of the district (if available), with other topic areas within and across domains, and across respondent groups.
 - How does our school's instructional staff Emotional Safety scale score compare with our school's instructional staff scores on other topic areas within the Safety domain—is it relatively low or high, or in the middle?
-

GQ3. What does our **noninstructional staff** Emotional Safety scale score tell us about how staff perceive emotional safety in our school?

For example, you can examine:

- How does our school's noninstructional staff Emotional Safety scale score compare with our district's score (if available)?
 - How does our school's noninstructional staff Emotional Safety scale score compare with our state's score (if available)?
 - How does our school's noninstructional staff Emotional Safety scale score compare with our school's noninstructional staff scores on other topic areas within the Safety domain—is it relatively low or high, or in the middle?
 -  Schools that use the EDSCLS can examine how the noninstructional staff benchmarked scale score levels compare with those of the district (if available), with other topic areas within and across domains, and across respondent groups.
-

A Targeted Approach

GQ4. What do the school Emotional Safety scale scores **by respondent characteristics** tell us about how each subgroup perceives emotional safety in our school?

For example, you can examine:

- How do the perceptions of emotional safety compare across various subgroups of students (e.g., White students versus Asian students)?
 - How do the perceptions of emotional safety compare across various subgroups of instructional staff (e.g., Black or African-American staff versus Asian staff)?
 - How do the perceptions of emotional safety compare across various subgroups of noninstructional staff (e.g., males versus females)?
 -  Schools that use the EDSCLS can examine how topic area benchmarked scale score levels compare across respondent groups and across respondent subgroups.
-

Now that you have considered these questions, what would you like to do next? You can:

- Click on [item-level data](#) to see how item-level results can help provide you with concrete examples of emotional safety that may be more immediately actionable.

Taking a deeper look within a single respondent group will allow for a more thorough picture of that group's perceptions. You also can:

- Click on [deeper guiding questions](#) to help you put all your data (survey, administrative, and qualitative) into context.
- Click on [Emotional Safety](#) to go to a webpage with suggestions for interventions that can be implemented immediately as well as longer term strategies and interventions.

Examining the deeper guiding questions will help you more thoroughly put your data into context and use them moving forward, whereas the webpage will provide recommendations on strategies and interventions that may be implemented immediately.

If you have calculated average (mean) Emotional Safety values, you also can:

- Click on [average \(mean\) Emotional Safety values](#) to look at Emotional Safety values across respondent groups.

Deeper Guiding Questions About Data for Schools

A Universal Approach

- DGQ1. Are there school-level databases that can give us additional information about what is going on **across stakeholders in the school** and what actions to take (e.g., administrative data such as incident data, attendance/truancy data, graduation rates, office discipline referrals and disciplinary actions, as well as other data such as Youth Risk Behavior Surveillance System survey data, if available)? (Click on the [Reference Manual](#) for more information on aligning indicators.)
- Do they show the same picture of school climate as your school's school climate survey data?
 - What additional information do these data give us?
 - How can we use these data to help us understand universal emotional safety needs in our school?
- DGQ2. Based on our overall Emotional Safety scale scores, should we consider emotional safety a priority for improvement in our school?

A Targeted Approach

- DGQ3. Are there other school-level databases that can tell us more about **subgroups of students or staff** needing support in emotional safety (e.g., administrative data such as incident data, attendance/truancy data, graduation rates, office discipline referrals and disciplinary actions, as well as other data such as Youth Risk Behavior Surveillance System survey data, if available)?
- Do they show the same picture of school climate as your school's school climate survey data?
 - What additional information do these data give us?
 - How can we use these data to help us understand targeted emotional safety needs in our school?

- DGQ4. If we are using a three-tiered system of support in our school, what do these data tell us about our use of resources within that system? Are our practices and programs addressing the needs identified by our data?
- a. What are our school's Tier 1 resource distribution needs? Tier 2 needs? Tier 3 needs?
- DGQ5. Based on our scale scores **by respondent characteristics**, should we consider emotional safety for certain subgroups of students and staff a priority for improvement in our school?

Other Questions to Consider

- DGQ6. How can we drill down to further understand what students and other stakeholders think about emotional safety needs in our school (e.g., convene focus groups of students, staff, parents/guardians; conduct student fishbowls and facilitated discussion sessions).
- DGQ7. Based on our answers to these questions, what conversations do we need to have about using our resources, and with whom should we have them?

Deeper Guiding Questions About Interventions¹⁰ for Schools

A Universal Approach

- DGQ8. What interventions pertaining to emotional safety are currently in place in our school and how can we best evaluate whether these interventions are working?
- DGQ9. How can we ensure that these emotional safety interventions are implemented with fidelity?
- DGQ10. How do we know which interventions are effective?
- a. How can we best evaluate whether these interventions are working?

A Targeted Approach

- DGQ11. If we are using a three-tiered system of support in our school, what interventions pertaining to emotional safety have been shown to work that should be continued or expanded at each tier?
- DGQ12. What interventions pertaining to emotional safety have been shown to work in other schools, per tier, and what are the conditions under which they work?
- DGQ13. What resources do we need to improve emotional safety for our students, per tier, in our school?
- DGQ14. Which subgroups of respondents have been found to be in need of targeted support?
- DGQ15. What interventions pertaining to emotional safety have worked or are working and should be continued or expanded for students at higher levels of risk in our district?

¹⁰ Click on the [Reference Manual](#) for more information about interventions such as best practices, strategies, and programs; multi-tiered systems of support; and fidelity of implementation

DGQ16. What new interventions pertaining to emotional safety can be introduced and implemented that will either provide new support or complement what is already being done at each tier?

a. Why do we think these interventions would be more effective than current or past efforts?

DGQ17. How can we sustain (institutionalize) tiered support for improving conditions pertinent to emotional safety in our school?

Other Questions to Consider

DGQ18. How can we best fold training for implementing emotional safety interventions into professional development efforts?

a. Which training efforts have been successful or unsuccessful in the past?

b. Why were some efforts more successful than others?

Now that you have considered these questions, what would you like to do next? You can:

- Click on [item-level data](#) to see how item-level results can help provide you with concrete examples of emotional safety that may be more immediately actionable.
- Click on [Emotional Safety](#) to go to a webpage with suggestions for interventions that can be implemented immediately as well as longer term strategies and interventions.

If you have calculated average (mean) Emotional Safety values, you can also:

- Click on [average \(mean\) Emotional Safety values](#) to look at Emotional Safety values across respondent groups.

Appendix C: Additional Guiding Questions: District Average (Mean) Emotional Safety Values

You can use the guiding questions in this appendix to help you use your data to focus on universal and targeted approaches to emotional safety. In this appendix, you will find:

- Additional guiding questions (average [mean] Emotional Safety values)

Average (mean) Emotional Safety values (on a scale of 1–4) can help you gauge how favorably respondents perceive the topic area. Click on the [Data Interpretation Guide](#) to go to more information on average (mean) Emotional Safety values and an explanation of the scale of 1–4.

A Universal Approach

GQ1. What does our **student** average (mean) Emotional Safety value tell us about how students perceive emotional safety in our district?

For example, you can think about these comparisons:

Comparing across respondent groups:

- How does our student average (mean) Emotional Safety value compare with the average (mean) Emotional Safety value for instructional staff in our district? For noninstructional staff in our district?
- Comparing across topic areas:
- How does our student average (mean) Emotional Safety value compare with the student average (mean) value of other topic areas of interest within and outside of the Safety domain?

GQ2. What does our **instructional staff** Emotional Safety average (mean) value tell us about how these staff perceive emotional safety in our district?

For example, you can think about these comparisons:

Comparing across respondent groups:

- How does our **instructional staff** average (mean) Emotional Safety value compare with the average (mean) Emotional Safety value for noninstructional staff in our district? For students in our district?

Comparing across topic areas:

- How does our instructional staff average (mean) Emotional Safety value compare with the instructional staff average (mean) value of other topic areas of interest within and outside of the Safety domain?

Using average (mean) Emotional Safety values, you can compare the perceptions of students and staff within and outside of the Safety domain. These comparisons will help you make meaningful interpretations of the average (mean) Emotional Safety values.

See [Appendix C](#) in the *Data Interpretation Guide* for more information on interpreting average (mean) topic area values for EDSCLS users.

GQ3. What does our **noninstructional staff** average (mean) Emotional Safety value tell us about how staff perceive emotional safety in our district?

For example, you can think about these comparisons:

Comparing across respondent groups:

- How does our noninstructional staff average (mean) Emotional Safety value compare with the average (mean) Emotional Safety value for instructional staff in our district? For students in our district?

Comparing across topic areas:

- How does our noninstructional staff average (mean) Emotional Safety value compare with the noninstructional staff average (mean) value of other topic areas of interest within and outside of the Safety domain?
-

A Targeted Approach

GQ4. What do our average (mean) Emotional Safety values **by respondent characteristics** tell us about how **students** perceive emotional safety in our district?

For example, you can think about these comparisons:

Comparing across topic areas:

- How does the average (mean) Emotional Safety value for certain subgroups of students (e.g., female students) compare with that subgroup's average (mean) values on other topic areas within the Safety domain (e.g., female student average [mean] values on Physical Safety)?

Comparing across respondent subgroups:

- How does the average (mean) Emotional Safety value for certain student subgroups (e.g., female students) compare with that subgroup of instructional staff and noninstructional staff (i.e., female instructional staff and female noninstructional staff)?
-

GQ5. What do our average (mean) Emotional Safety values **by respondent characteristics** tell us about how **instructional staff** perceive emotional safety in our district?

For example, you can think about these comparisons:

Comparing across topic areas:

- How does the average (mean) Emotional Safety value for certain subgroups of instructional staff (e.g., Asian instructional staff) compare with that subgroup's average (mean) values on other topic areas within the Safety domain (e.g., Asian instructional staff average [mean] values on Physical Safety)?

Comparing across respondent subgroups:

- How does the average (mean) Emotional Safety value for certain instructional staff subgroups (e.g., Black or African-American instructional staff) compare with that subgroup of noninstructional staff and students (i.e., Black or African-American students and Black or African-American noninstructional staff)?
-

GQ6. What do our average (mean) Emotional Safety values **by respondent characteristics** tell us about how **noninstructional staff** perceive emotional safety in our district?

For example, you can think about these comparisons:

Comparing across topic areas:

- How does the average (mean) Emotional Safety value for certain subgroups of noninstructional staff (e.g., male noninstructional staff) compare with that subgroup's average (mean) values on other topic areas within the Safety domain (e.g., male noninstructional staff average [mean] values on Physical Safety)?

Comparing across respondent subgroups:

- How does the average (mean) Emotional Safety value for certain noninstructional subgroups (e.g., Asian noninstructional staff) compare with that subgroup of instructional staff and students (i.e., Asian students and Asian instructional staff)?
-

Now that you have considered these questions, what would you like to do next? You can:

- Click on [item-level data](#) to see how item-level results can help provide you with concrete examples of Emotional Safety that may be more immediately actionable.

You also can:

- Click on [deeper guiding questions](#) to help you put all your data (survey, administrative, and qualitative) into context.
- Click on [Emotional Safety](#) to go to a webpage with suggestions for interventions that can be implemented immediately as well as longer term strategies and interventions.

Examining the deeper guiding questions will help you more thoroughly put your data into context and use them moving forward, whereas the webpage will provide suggestions for strategies and interventions that may be implemented immediately.

Appendix D: Additional Guiding Questions: School Average (Mean) Emotional Safety Values

You can use the guiding questions in this appendix to help you use your data to focus on universal and targeted approaches to emotional safety. In this appendix, you will find:

- Additional guiding questions (average [mean] Emotional Safety values)

Average (mean) Emotional Safety values (on a scale of 1–4) can help you gauge how favorably respondents perceive the topic area. Click on the [Data Interpretation Guide](#) to go to more information on average (mean) Emotional Safety values and an explanation of the scale of 1–4.

A Universal Approach

GQ1. What does our **student** average (mean) Emotional Safety value tell us about how students perceive emotional safety in our school?

For example, you can think about these comparisons:

Comparing across respondent groups:

- How does our **student** average (mean) Emotional Safety value compare with the average (mean) Emotional Safety value for instructional staff in our school? For noninstructional staff in our school?

Comparing across topic areas:

- How does our student average (mean) Emotional Safety value compare with the student average (mean) value of other topic areas of interest within and outside of the Safety domain?

GQ2. What does our **instructional staff** Emotional Safety average (mean) value tell us about how these staff perceive emotional safety in our school?

For example, you can think about these comparisons:

Comparing across respondent groups:

- How does our instructional staff average (mean) Emotional Safety value compare with the average (mean) Emotional Safety value for noninstructional staff in our school? For students in our school?

Comparing across topic areas:

- How does our instructional staff average (mean) Emotional Safety value compare with the instructional staff average (mean) value of other topic areas of interest within and outside of the Safety domain?

Using average (mean) Emotional Safety values, you can compare the perceptions of students and staff within and outside of the Safety domain. These comparisons will help you make meaningful interpretations of the average (mean) Emotional Safety values.

See [Appendix C](#) in the *Data Interpretation Guide* for more information on interpreting average (mean) topic area values for EDSCLS users.

GQ3. What does our **noninstructional staff** average (mean) Emotional Safety value tell us about how staff perceive emotional safety in our school?

For example, you can think about these comparisons:

Comparing across respondent groups:

- How does our noninstructional staff average (mean) Emotional Safety value compare with the average (mean) Emotional Safety value for instructional staff in our school? For students in our school?

Comparing across topic areas:

- How does our noninstructional staff average (mean) Emotional Safety value compare with the noninstructional staff average (mean) value of other topic areas of interest within and outside of the Safety domain?
-

A Targeted Approach

GQ4. What do our average (mean) Emotional Safety values **by respondent characteristics** tell us about how **students** perceive emotional safety in our school?

For example, you can think about these comparisons:

Comparing across topic areas:

- How does the average (mean) Emotional Safety value for certain subgroups of students (e.g., female students) compare with that subgroup's average (mean) values on other topic areas within the Safety domain (e.g., female student average [mean] values on Physical Safety)?

Comparing across respondent subgroups:

- How does the average (mean) Emotional Safety value for certain student subgroups (e.g., female students) compare with that subgroup of instructional staff and noninstructional staff (i.e., female instructional staff and female noninstructional staff)?
-

GQ5. What do our average (mean) Emotional Safety values **by respondent characteristics** tell us about how **instructional staff** perceive emotional safety in our school?

For example, you can think about these comparisons:

Comparing across topic areas:

- How does the average (mean) Emotional Safety value for certain subgroups of instructional staff (e.g., Asian instructional staff) compare with that subgroup's average (mean) values on other topic areas within the Safety domain (e.g., Asian instructional staff average [mean] values on Physical Safety)?

Comparing across respondent subgroups:

- How does the average (mean) Emotional Safety value for certain instructional staff subgroups (e.g., Black or African-American instructional staff) compare with that subgroup of noninstructional staff and students (i.e., Black or African-American students and Black or African-American noninstructional staff)?
-

GQ6. What do our average (mean) Emotional Safety values **by respondent characteristics** tell us about how **noninstructional staff** perceive emotional safety in our school?

For example, you can think about these comparisons:

Comparing across topic areas:

- How does the average (mean) Emotional Safety value for certain subgroups of noninstructional staff (e.g., male noninstructional staff) compare with that subgroup's average (mean) values on other topic areas within the Safety domain (e.g., male noninstructional staff average [mean] values on Physical Safety)?

Comparing across respondent subgroups:

- How does the average (mean) Emotional Safety value for certain noninstructional subgroups (e.g., Asian noninstructional staff) compare with that subgroup of instructional staff and students (i.e., Asian students and Asian instructional staff)?
-

Now that you have considered these questions, what would you like to do next? You can:

- Click on [item-level data](#) to see how item-level results can help provide you with concrete examples of Emotional Safety that may be more immediately actionable.
- Click on [deeper guiding questions](#) to help you put all your data (survey, administrative, and qualitative) into context.
- Click on [Emotional Safety](#) to go to a webpage with suggestions for interventions that can be implemented immediately as well as longer term strategies and interventions.

Examining the deeper guiding questions will help you more thoroughly put your data into context and use them moving forward, whereas the webpage will provide suggestions for strategies and interventions that may be implemented immediately.

Disclaimer

This *Interpreting Emotional Safety Topic Area Discussion Guide* was designed and written under the U.S. Department of Education (Department) Contract Number EDESE12O0035 by the American Institutes for Research, the National Center on Safe Supportive Learning Environments (NCSSLE). Rita Foy Moss served as the contracting officer's representative (COR) for the NCSSLE technical assistance center. This document contains resource materials that are provided for the user's convenience. The inclusion of these materials is not intended to reflect their importance, nor is it intended to endorse any views expressed, or products or services offered. These materials may contain the views and recommendations of various subject matter experts as well as hypertext links, contact addresses, and websites to information created and maintained by other public and private organizations. The opinions expressed in any of these materials do not necessarily reflect the positions or policies of the Department.
